

How do inductors store energy? Inductors,fundamental components in electrical circuits,possess the remarkable ability to store energy in the form of a magnetic fieldwhen an electric current flows through them. This energy storage capability is crucial in various applications,from power supplies to radio transmitters.

Do inductors store energy in a magnetic field? Like Peter Diehr says in the comments, the way to see the duality between inductors and capacitors is that capacitors store energy in an electric field, inductors store energy in a magnetic field. But if we cut off current, will the magnetic field stay there?

What happens if we continuously give current to an inductor? Also, if we continuously give current to an inductor, it will create a continuously increasing magnetic fielduntil it reaches a maximum and stop the flow of current, similar to what capacitors do? As capacitors store energy in the electric field, so inductors store energy in the magnetic field.

What are inductors used for? Inductors are passive electronic components that store energyin their magnetic field when an electric current flows through them. They are often used in electrical and electronic circuits to oppose changes in current, filter signals, and store energy.

Does an inductor take more energy? Thus, the inductor takes no more energy, albeit its internal resistance does cause some losses as the current flows through it, such that Plosses= Im2R. These losses are unavoidable because the constant current flow is necessary to maintain the magnetic fields.

When does the energy stored by an inductor stop increasing? The energy stored by the inductor increases only while the current is building up to its steady-state value. When the current in a practical inductor reaches its steady-state value of Im = E/R, the magnetic field ceases to expand.

To start with, there's no voltage across or current through the inductor. When the switch closes, current begins to flow. As the current flows, it creates a magnetic field. That takes energy, which comes from the electrons. ???

Like a capacitor, inductors store energy. But unlike capacitors that store energy as an electric field, inductors store their energy as a magnetic field. If we pass a current through an inductor we induce a magnetic field in the coil. ???
