What is compressed carbon dioxide energy storage (CCES)? They are now characterized as large-scale, long-lifetime and cost-effective energy storage systems. Compressed Carbon Dioxide Energy Storage (CCES) systems are based on the same technology but operate with CO<sub>2</sub> as working fluid. They allow liquid storage under non-extreme temperature conditions.

Can compressed carbon dioxide storage be used for power systems? The experimental research and demonstration projects related to compressed carbon dioxide storage are presented. The suggestions and prospects for future research and development in compressed carbon dioxide storage are offered. Energy storage technology is supporting technology for building new power systems.

Why do we need a carbon storage model? Broadly usable and integrated carbon storage models are vital for both scientific understanding and effective climate policy. Global carbon markets, reforestation projects, and national commitments under the Paris Agreement (i.e. NDCs and the new 2030 targets) all depend on reliable carbon estimates.

What are the latest developments in carbon dioxide storage system (CCES)? The CCES projects, including carbon dioxide battery in Italy and carbon dioxide storage demonstration system in China, have also been completed. This paper carries out a comprehensive summary and performance comparison of latest developments in CCES, including theoretical research, experimental studies and demonstration projects.

Are depleted hydrocarbon reservoirs suitable for CO<sub>2</sub> storage? Enhancement of Storage Efficiency during Carbon Dioxide Sequestration in Depleted Reservoirs Carbon capture and storage (CCS) is crucial for mitigating atmospheric carbon dioxide (CO<sub>2</sub>) levels in the clean energy transition. Depleted hydrocarbon reservoirs, with their proven containment integrity, are promising candidates for CO<sub>2</sub> storage.

How do we estimate carbon storage in the 21st century? Recent global-scale studies focusing on mapping carbon storage in the first two decades of the 21st century exemplify divergent approaches to carbon storage estimation. For example, used machine learning to derive Above Ground Biomass (AGB) estimates from satellite data and environmental features.
