

COMPARISON OF LIQUID COOLING AND AIR COOLING ENERGY STORAGE COSTS

Is liquid cooling more efficient than air cooling? The liquid cooling system is more efficient than the air-cooling system within the investigated range of power consumption as it is capable of keeping the temperature lower than the air cooling method. Fig. 19. Average temperature increases in the hottest cell versus power consumption.

Is liquid cooling better than air cooled data center? It demonstrates that for like densities (10kW/rack), the data center cost of an air-cooled and liquid-cooled data center are roughly equal. But as described above, liquid cooling also enables compaction of the IT, and with compaction, there is an opportunity for a capex savings.

What is the difference between air cooling and liquid cooling? The temperature difference of the hottest cell between air cooling and liquid cooling reduces with an increase in power consumption. For the power consumption of 0.5 W, the average temperature of the hottest cell with the liquid cooling system is around 3 °C lower than the air cooling system.

Does liquid cooling save space? Although there is no compaction of the IT white space, facility space is saved by the reduction of cooling system switchgear and UPS systems. Savings include other associated costs linked to space, like fire suppression, lighting, etc. Additionally, liquid cooling does not require any air containment, so this is removed.

Should you choose liquid cooling over traditional air cooling? There are several known benefits of choosing liquid cooling over traditional air cooling including energy savings. Capital cost, however, is viewed as a common obstacle.

How much power does a liquid cooling system consume? For the power consumption of 0.5 W, the average temperature of the hottest cell with the liquid cooling system is around 3 °C lower than the air cooling system. For 13.5 °C increase in the average temperature of the hottest cell, the ratio of power consumption is around $PR = 860$.
