

# DEMAND CHARGE ENERGY STORAGE SOLUTION

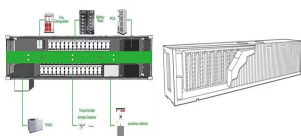

What is a demand charge? Unlike residential consumers, who are charged primarily for their kWh (energy) consumption, larger electricity consumers must also pay demand charges on a kW (power) basis. To calculate the demand charge of a facility, the utility notates the highest average 15 minute period during a billing cycle.

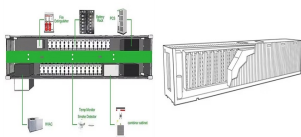

How can energy storage systems meet the demands of large-scale energy storage? To meet the demands for large-scale, long-duration, high-efficiency, and rapid-response energy storage systems, this study integrates physical and chemical energy storage technologies to develop a coupled energy storage system incorporating PEMEC, SOFC and CB.

Can a large-capacity hydrogen storage system meet the demand for energy storage? For instance, if the portion of electricity with rapid fluctuations and the user's peak load are relatively small, a larger-capacity CB could serve as the base load for energy storage, while a smaller-capacity hydrogen storage system could meet the demand for rapid-response energy storage.

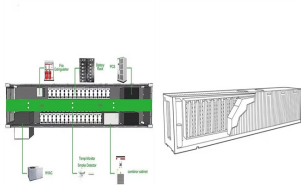

How is a demand charge calculated? To calculate the demand charge of a facility, the utility notates the highest average 15 minute period during a billing cycle. This is a surcharge on top of standard kWh rates and often times is a substantial portion of the total bill. To illustrate how a demand charge works consider the following examples:

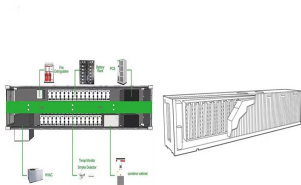

How does a solar energy storage system work? The blue line is the one to pay attention to here. When the energy storage system senses a peak demand event it discharges the stored energy at a rate capable of curbing the facilities demand. With a properly sized solar plus storage system the building's net load is decreased from a peak of about 850 kW to approximately 700 kW.
