What is the future of energy storage? Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Is energy storage a luxury? Energy storage technology is recognized as an underpinning technology to have great potential in coping with a high proportion of renewable power integration and decarbonizing power system. However, the costs of energy storage facilities remain high-level and it makes energy storage a luxury in many application fields.

Is energy storage system a viable solution for high-proportion renewable power integration? Energy Storage System (ESS) has flexible bidirectional power regulation capabilities and has provided an effective means to address the challenges of high-proportion renewable power integration. However, hindered by many factors, the large-scale development and application of ESS still face many bottlenecks.

What is shared energy storage (CES)? CES is a shared energy storage technology that enables users to use the shared energy storage resources composed of centralized or distributed energy storage facilities at any time, anywhere on demand. Users won't need to build their ESS but pay for the energy storage services they obtain.

Can CES users rent a shared energy storage capacity? Users are allowed to rent their shared energy storage capacities to each other to maximize their economic benefits. The pricing scheme of the CES service fee is determined according to the charging/discharging behaviors and so caused battery life losses.

What is a typical application scenario of energy storage on the grid?  
Another typical application scenario of energy storage on the grid side is the emergency power support for the system such as emergency reserve. Considering that the provision of grid-side CES services relies on solid grid infrastructure, the failure of the grid may cause the cascading failure of CES.
