

DISTRIBUTED POWER GENERATION AND ENERGY STORAGE EXPECTATIONS

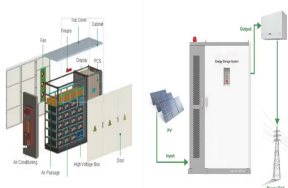

What are the benefits of energy storage system & distributed generation? Generally speaking, the main benefits of installing energy storage system (ESS) and distributed generation (DG) in distribution systems are : (i) to reduce carbon emissions; (ii) to balance the unpredictable fluctuations of renewable energy and demand; (iii) to reduce the energy exchanges at substations and to reduce the total power losses.

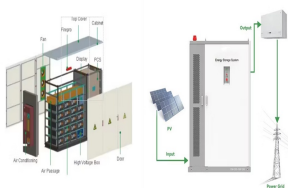

Should energy storage systems be integrated in a distribution network? Introducing energy storage systems (ESSs) in the network provide another possible approach to solve the above problems by stabilizing voltage and frequency. Therefore, it is essential to allocate distributed ESSs optimally on the distribution network to fully exploit their advantages.

Can distributed storage units improve system reliability? Awad et al. proposed a model for the improvement of system reliability through the allocation of distributed storage units in distribution systems. A probabilistic approach is applied to consider the uncertainty of system components, rather than a time-series pattern.

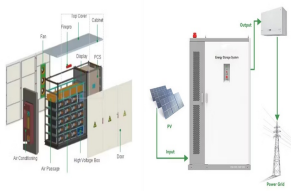

What are the benefits of capacity configuration of DGS? Capacity configuration of DGs and their installation at suitable locations can effectively reduce system power loss, improve the voltage profile of the power grid, minimize the system operation cost, and improve the power quality and reliability of the power system , , , , , .

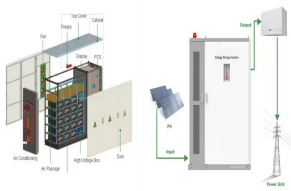

What is distributed generation (DG)? Introduction Distributed generation (DG) comprises a small-scale power generation device installed near consumer terminals in the distribution network . DGs can be categorized as renewable or non-renewable. Renewable DGs contain solar, wind, geothermal, and ocean energy .

What happens if energy storage is randomly allocated? The investment cost of energy storage may increase if the ESSs are randomly allocated. This would also increase power loss, decrease voltage quality, and deteriorate the economic operation of the power system.
