

ECONOMIC CALCULATION MODEL FOR LARGE-SCALE ENERGY STORAGE

How are financial and economic models used in energy storage projects? Financial and economic modeling are undertaken based on the data and assumptions presented in Table 1. Table 1. Project stakeholder interests in KPIs. To determine the economic feasibility of the energy storage project, the model outputs two types of KPIs: economic and financial KPIs.

What is a large-scale energy storage system? Pumped-hydro energy storage (PHES) plants with capacities ranging from several MW to GW and reasonably high power efficiencies of over 80% [4,5] are well-established long-term energy storage systems. Compressed air energy storage is another widely established large-scale EES alternative (CAES).

How can a financial model improve energy storage system performance? The model may integrate more data about energy storage system operation as they have an impact on the system lifetime. This will have an influence on the financial outcomes. The existing financial model may be enhanced by adding new EES technical details. There are various valuation methods for energy storage.

What are the valuation methods for energy storage? There are various valuation methods for energy storage. Other valuation options may be utilized by the financial model to account for technical, economic, and financing uncertainty. To optimize income, an energy arbitrage algorithm can be used. 8. Conclusion

What ratios are used in energy storage systems? Debt management, profitability, liquidity, asset management and market trends are the five sets of ratios mostly utilized. In the analysis, only project finance-related ratios are covered. The operating waterfall of the investigated energy storage systems is shown in Fig. 7.

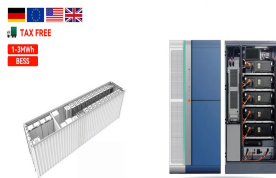

ECONOMIC CALCULATION MODEL FOR LARGE-SCALE ENERGY STORAGE

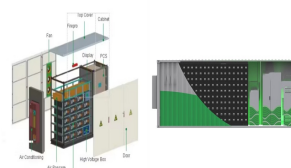

What is an energy storage system? A facility which is an asset with a specified purpose; in this case, an energy storage system, is located at the center. The asset must be capable of functioning as a stand-alone economic entity. Fig. 4. Project finance structure.

Most TEA starts by developing a cost model. In general, the life cycle cost (LCC) of an energy storage system includes the total capital cost (TCC), the replacement cost, the fixed ???
