

EFFECT OF A LIVING ROOM BACKGROUND WALL THAT CAN STORE ELECTRICITY

What are the benefits of Living Walls? Most studies focus on the energy benefits of the living walls that help to cool down the indoor spaces and reduce energy consumption and carbon emissions from the building sector. Living walls also have a carbon reducing benefit as they are able to sequester Carbon Dioxide (CO₂). 1. Introduction

Are living walls good for the environment? A growing number of living wall studies in the recent decade indicate the increasing interest in the environmental benefits of this greening system. Most studies focus on the energy benefits of the living walls that help to cool down the indoor spaces and reduce energy consumption and carbon emissions from the building sector.

Are living walls a carbon reducing benefit? Living walls also have a carbon reducing benefit as they are able to sequester Carbon Dioxide (CO₂). 1. Introduction Living walls (LWs) are the advanced technology of greening system for the vertical surface of a building.

How much energy does an external wall consume? The energy performances of an external wall made of different materials are close to that of 240mm-thickness bricks. For example, the cooling energy consumption of a room with an 850mm-thickness-marble external wall is approximately equal to that with a 240mm-thickness-brick external wall.

Do LW walls affect energy performance? The orientation of the LW walls also has a strong effect on energy performance of the LWs. In the tropical climate of Brisbane, north-facing vegetated facades were able to reduce 9% of cooling loads compared to west-facing facade, which reduce only 1% of cooling loads.

How much energy does a wall use? This study may provide a roadmap for the material scientists interested in developing high-performance wall materials. The total final energy consumption worldwide increased from 4,672 Mtoe (million tons of oil equivalent, 1 Mtoe \approx 4.1868 \times 10¹² 4 trillion joule) to 8,979 Mtoe between 1973 and 2012.

Here, we report the relative electrical load needed to light a room at the 500 lux level specified by European lighting standard EN12464-1:2011, as a function of wall brightness. A room was painted white, black, and two
