How is energy storage determined? The energy storage in Electrochemical Energy Storage Systems is determined by the quantity of material used (Faraday's law) and the voltage curve during discharging. In the context of batteries, the measure used is called A\hour capacity. (Note: In electrical engineering, the term 'capacity' is used differently, here it refers to the charge quantity that can be stored in a battery).

An inductor, also called a coil, choke, or reactor, is a passive two-terminal electrical component that stores energy in a magnetic field when electric current flows through it. [1] An inductor typically consists of an insulated wire wound into a coil.. When the current flowing through the coil changes, the time-varying magnetic field induces an electromotive force (emf) in the conductor
