

ENERGY STORAGE AND GAS CYLINDERS

What is a gas cylinder used for? In manufacturing, gas cylinders are used for storing fuel for heating systems, vehicles, and torches as well as storing the source of energy for power tools or assembly line machinery. Medical gas cylinders provide supplemental oxygen, nitrous oxide (anesthetic functions), nitrogen (surgical tools), and carbon dioxide (to inflate tissue).

How long should a gas cylinder be stored? Longer term storage of gas cylinders (greater than two years) can lead to potential problems or incidents, increase the risks associated with cylinder movement, result in the degradation of cylinder condition, and add to the costs of compressed gas use and cylinder management.

What gases can a gas cylinder store? Gas cylinders store gases under high pressures. Gas cylinders can store both flammable gases, such as acetylene, and inert gases such as helium. Many countries have different color coding systems that are used to classify different gases and types of cylinders.

What is a medical gas cylinder? Medical gas cylinders provide supplemental oxygen, nitrous oxide (anesthetic functions), nitrogen (surgical tools), and carbon dioxide (to inflate tissue). The International Organization for Standardization (ISO) technical committee developing standards for specifying the standardization of gas cylinders and their fittings is ISO/TC 58.

What types of compressed gases are stored in gas cylinders? The three main types of compressed gases that are stored in gas cylinders include: Liquefied gases are gases which can become liquids at normal temperature when they are inside cylinders under pressure. They exist inside the cylinder in a liquid-vapor balance or equilibrium.

ENERGY STORAGE AND GAS CYLINDERS

Can a gas cylinder be stored outside? Cylinders should not be exposed to continuous dampness and should not be stored near salt,corrosive chemicals or fumes. Rusting will damage cylinders and may cause valve protection caps to stick (see Compressed Gas Association [CGA]Pamphlet P-1-1965). If placed in outdoor storage,cylinders often begin to degrade after two to three years.

Special care should be taken when dealing with compressed gas cylinders, such as an argon gas cylinder, to prevent falling and breaking and to ensure proper ventilation. Typically, a gas cylinder rack or gas cylinder cabinet is used to ???
