What are functional thermal fluids? As a new type of fluid, functional thermal fluids mainly include nanofluids (NFs) and phase change fluids (PCFs), which have the advantages of high thermal conductivity and high specific heat, can effectively improve the heat transfer efficiency and temperature uniformity of liquid cooling system.

What properties are required for functional thermal fluids in BTMS applications? Some of the properties currently required for functional thermal fluids in BTMS applications are: (a) High thermal energy carrying density; (b) high speed transmission of heat energy; (c) low pump consumption in pipeline transport. Of course, good stability is the premise of improving these performances.

What are the advantages of functional thermal fluids? As a new type of fluids, functional thermal fluids have the advantages of high heat storage density, large heat transfer rate and wide application range, thus reducing heat loss in the process of heat storage and heat transfer, and miniaturizing heat exchangers and corresponding pipelines.

What is battery thermal management system (BTMS) based on functional thermal fluids? Then, battery thermal management system (BTMS) based on functional thermal fluids is summarized in detail, and the thermal management effects and pump consumption are compared with that of water-based BTMS.

How to develop functional thermal fluids with high heat carrying density? Therefore, in order to develop functional thermal fluids with high heat carrying density and high heat transfer rate, some researchers consider combining the advantages of NFs and PCFs, and adding NPs and PCM particles into the base fluids at the same time to form composite fluids.
