

ENERGY STORAGE HEAT PUMP STEAM GENERATOR

What is steam generating heat pump (sghp)? In addition, modified heat pumps for the supply of steam??? so-called steam generating heat pumps (SGHP) ??? have been developed. Since steam is the main heat carrier in the low- and medium-temperature range (up to 300 °C), SGHPs enable the use of HPs in various industrial processes and promote decarbonization of the industrial sector.

Can a heat pump generate steam? With increasing supply temperatures of HTHP, new fields of application ??? such as steam generating heat pump ??? emerge. In this paper, over 40 SGHP designs were analyzed and clustered into five fundamental concepts for generating steam with heat pump technologies.

Could a heat pump be a sustainable heating system for industrial steam generation? The key parameters of the heat pump for steam generation are ascertained and the subsequent optimization space is discussed. The results show that the proposed steam-generation path has clear performance advantages and potential for industrial steam generation, which could be a sustainable heating system for industry.

How sghp-C is used for steam generation? For steam generation, a design according to the concept SGHP-C is used (TRL 6). The heat pump provides pressurized hot water, which is circulated in a closed-loop circuit and used as a heat source in a shell and plate type steam generator. In a presented example, steam at 5 bar to 17 bar is provided.

Do heat pumps improve sghps? Since the operational limits of SGHPs (such as the steam temperature and steam pressure) are directly constraint by the individual heat pump technologies, further development of the (high- and very-high temperature) heat pumps lead to a direct improvement of SGHPs.

What is a single steam source heating storage approach? In the single steam source heating storage approach, the sensible heat of high-temperature steam is utilized, while low-temperature steam is discharged into the condenser without further use after heat exchange, leading to increased cold-source losses and a decrease in thermal efficiency.
