2 ? This article deals with the modeling and control of a solid-state transformer (SST) based on a dual active bridge (DAB) and modular multilevel converter (MMC) for integrating solar photovoltaic (SPV) and battery energy storage (BES) systems into the grid.

As renewable energy sources are becoming increasingly prevalent, there is a growing need for effective energy storage and management solutions. Integrating transformers with energy storage systems is a promising solution for improving grid stability and efficiency, particularly in the context of renewable energy integration.

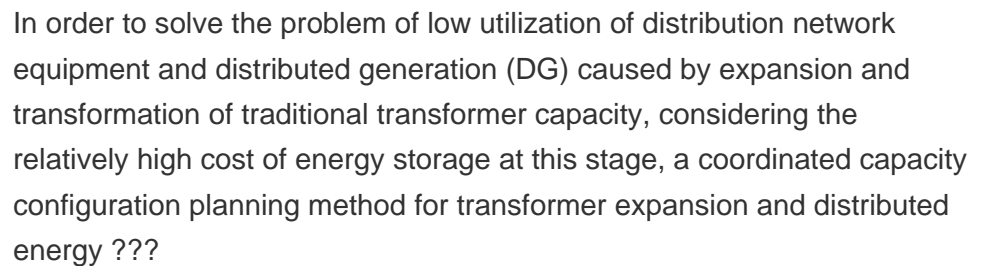

1.1 Introduction. Storage batteries are devices that convert electricity into storable chemical energy and convert it back to electricity for later use. In power system applications, battery energy storage systems (BESSs) were mostly considered so far in islanded microgrids (e.g., []), where the lack of a connection to a public grid and the need to import fuel ???

An absorption-based energy storage heat transformer (ESHT) can achieve temperature upgrading with satisfactory storage performance. To further improve the system performance, a novel compression-assisted ESHT (CESHT) is proposed. The dynamic characteristics of the basic ESHT and CESHT cycles are analyzed and compared. Then, the ???

Any cable linked to the side faces of the MFE will transmit energy into it. The MFE itself will as well EMIT energy, through the top and bottom faces. Even more, the MFE contains an integrated ENERGY STORAGE. Yes, that's right, it can effectively contain an amount of energy, comparable to 60 RE BATTERIES(or 10 Energy Crystals).

There is a trade-off between the energy storage performance and the heat transformer ability. As the temperature lift decreases from 50 °C to 10 °C, the energy storage efficiency increases from 0.21 to 0.44, while the energy storage density rises from 42.4 kWh/m<sup>3</sup> to 292.7 kWh/m<sup>3</sup>, under a charging temperature of 90 °C.

The PV and other storage systems help to shave the peak-load of the power consumption curve. The PV can convert the energy of solar radiation to the electricity for EV charging. As shown in Fig. 2, the PV injects its energy to the common DC bus, and this energy is used to supply EV batteries. This feature is called sun-to-vehicle (S2V).

An absorption energy storage heat transformer with adequate energy storage and temperature lift characteristics effectively addresses this challenge. An advancement in this technology is the double-stage energy storage heat transformer (DESHT), which further enhances the range of temperature upgrade through twice temperature lifts.
