ESST is focusing on both fundamental and applied

Abstract: At present energy storage power stations distributed in northwestern provinces in China were put into operation one after another and it provided valuable practical experiences for the development of energy storage power stations. However, there was short of uniform design specifications and criteria for the construction of energy storage power stations.

In 2018, the 100-MW grid-side energy storage power station demonstration project in Zhenjiang, Jiangsu Province, was put into operation, initiating demonstrations and explorations of commercial models. During this period, the installed capacity of energy storage systems increased rapidly. The accumulated installed capacity in 2023 was nearly 97

With a low-carbon background, a significant increase in the proportion of renewable energy (RE) increases the uncertainty of power systems [1, 2], and the gradual retirement of thermal power units exacerbates the lack of flexible resources [3], leading to a sharp increase in the pressure on the system peak and frequency regulation [4, 5]. To circumvent this
