What can new towns do for energy storage? (3) New energy storage New towns will accelerate the implementation of typical user-side energy storage scenarios in industrial parks and data centers, supporting the construction of a series of energy storage demonstration projects. (4) Digital-real integration

What is the future of energy storage? In addition to the U.S. government's climate goals, the growth of electric vehicle usage, increased deployment of variable renewable generation, and declining costs of storage technologies are among other drivers of expected future growth of the energy storage market.

What is thermal energy storage? Thermal energy storage (TES) is one of several approaches to support the electrification and decarbonization of buildings. To electrify buildings efficiently, electrically powered heating, ventilation, and air conditioning (HVAC) equipment such as a heat pump can be integrated with TES systems.

Is space heating and cooling a viable energy storage solution? Space heating and cooling account for up to 40% of the energy used in commercial buildings.¹ Aligning this energy consumption with renewable energy generation through practical and viable energy storage solutions will be critical to achieving 100% clean energy by 2050.

Why is storage important in a building? Storage sited at buildings can serve as important resources to promote grid reliability and flexibility, increase renewable penetration, and increase energy resilience. Current thermally driven loads make up more than 45% of the annual electrical energy consumed on-site in residential and commercial buildings (Figure 1).
