What is a Li???metal anode protection layer for lithium???oxygen batteries? Lee and co-workers proposed a Li???metal anode protection layer for lithium???oxygen batteries based on  $\text{Al}_2\text{O}_3$  and polyvinylidene fluoride-hexafluoro propylene(PVDF-HFP). The interface possessed a robust shield from inorganic particles and a highway for  $\text{Li}^+$  fast transport stemming from the dramatically high electrolyte uptake ratio .

Can solid-state lithium metal batteries match high-voltage cathodes and lithium metal anodes? In the pursuit of next-generation energy storage systems,solid-state lithium metal batteries (SSLMBs) that can match both high-voltage cathodes and lithium metal anodeshave attracted considerable attention in both industry and academia due to their high-energy density,enhanced safety,and cycle-life benefits.

Can solid-state lithium metal batteries replace liquid electrolytes? Replacing liquid electrolytes with solid electrolytes (SEs) is one of the most promising strategies to address this issue. The emerging solid-state lithium metal batteries (SSLMBs) provide a new chance to achieve both high energy and high safety by matching high-voltage cathodes, inherently safe SEs, and high-capacity lithium metal anodes.

Does the NLI protective layer suppress lithium dendrite growth? The results show that the NLI protective layer can not only suppress lithium dendrite growththrough its robust-flexible physical properties,but also decrease the shuttle effect of lithium polysulfide,demonstrating its excellent industrial applications in high-energy Li-S batteries. 3. Conclusion

Are compatible solid electrolytes necessary for high-voltage solid-state lithium metal batteries (sslmbs)? 161. Designing compatible solid electrolytes (SEs) is crucialfor high-voltage solid-state lithium metal batteries (SSLMBs). This review summarizes recent advancements in the field,providing a detailed understanding of interfacial degradation

Can artificial protective layers suppress dendritic lithium growth? Rational design of artificial protective layers with low resistance, high mechanical strength and good compliance is desirable to suppress dendritic lithium growth, thus realizing the superiority of Li metal anode for high-energy devices such as large electric grids and electrical vehicles.
