

## FLYWHEEL ENERGY STORAGE TECHNOLOGY IN THE UNITED STATES

What is a flywheel energy storage system? A flywheel energy storage system is a mechanical device used to store energy through rotational motion. When excess electricity is available, it is used to accelerate a flywheel to a very high speed. The energy is stored as kinetic energy and can be retrieved by slowing down the flywheel, converting the motion back into electricity.

Why do we need advanced flywheel energy storage systems? This brings us to the pressing need for innovative solutions such as Advanced Flywheel Energy Storage Systems (FESS),which offers a sustainable and efficient alternative. FESS offers unparalleled longevity and reliability,with lifespans exceeding 50,000 cycles and design lives of over 25 years.

What is the difference between a flywheel and a battery storage system? Flywheel Systems are more suited for applications that require rapid energy bursts, such as power grid stabilization, frequency regulation, and backup power for critical infrastructure. Battery Storage is typically a better choice for long-term energy storage, such as for renewable energy systems (solar or wind) or home energy storage.

Can flywheel energy storage be commercially viable? This project explored flywheel energy storage R&D to reach commercial viability for utility scale energy storage. This required advancing the design, manufacturing capability, system cost, storage capacity, efficiency, reliability, safety, and system level operation of flywheel energy storage technology.
