Does fuzzy logic control support microgrid frequency? This paper proposes an optimal control strategy based on fuzzy logic control (FLC) to support the microgrid (MG) frequency. In addition to frequency regulation, this strategy includes supplementary control units to protect the battery and manage the battery state of charge (SoC).

Can a battery energy storage system control the microgrid frequency? Battery energy storage systems (BESSs) can play a key role to regulate the frequency and improve the system stability considering the low inertia nature of inverter-based DGs. This paper proposes an optimal control strategy based on fuzzy logic control (FLC) to support the microgrid (MG) frequency.

How can fuzzy modeling improve the dynamic response of a battery? One of the most important parts of fuzzy modeling is determining the membership functions and their types. Hence, determining the shape and type of membership functions using the neural network to improve the dynamic response of the battery can also be used as an attractive topic for future work.

Do battery energy storage systems regulate system frequency? The penetration of renewable energy resources (RERs) in modern power systems has a significant impact on system frequency. Battery energy storage systems (BESSs) can play a key role to regulate the frequency and improve the system stability considering the low inertia nature of inverter-based DGs.

Does the proposed frequency control unit support MG frequency? Based on these input variables and defined fuzzy rules, the proposed frequency control unit has supported the MG frequency. The undershoot of the proposed control is equal to 0.16% and the settling time is equal to 7 s.
