Flywheel technology has the potential to be a key part of our Energy Storage needs, writes Prof. Keith Robert Pullen: Electricity power systems are going through a major transition away from centralised fossil and nuclear based generation towards renewables, driven mainly by substantial cost reductions in solar PV and wind.

Flywheel energy storage systems are feasible for short-duration applications, which are crucial for the reliability of an electrical grid with large renewable energy penetration. Flywheel energy storage system use is increasing, which has encouraged research in design improvement, performance optimization, and cost analysis.

Flywheel energy storage (FES) is a technology that stores kinetic energy through rotational motion. The stored energy can be used to generate electricity when needed. Flywheels have been used for centuries, but modern FES systems use advanced materials and design techniques to achieve higher efficiency, longer life, and lower maintenance costs.

Today, flywheel energy storage systems are used for ride-through energy for a variety of demanding applications surpassing chemical batteries. A flywheel system stores energy mechanically in the form of kinetic energy by spinning a mass at high speed. Electrical inputs spin the flywheel rotor and keep it spinning until called upon to release

"Energy storage technologies range from mechanical systems like flywheel and pumped-hydrogen storage to electrochemical solutions such as lithium-ion batteries and chemical options like fuel cells," it says. "While lithium-ion batteries remain the dominant technology due to their high energy density, alternatives such as sodium-ion and

The flywheel energy storage operating principle has many parallels with conventional battery-based energy storage. The flywheel goes through three stages during an operational cycle, like all types of energy storage systems: The flywheel speeds up: this is the charging process. Charging is interrupted once the flywheel reaches the maximum

Forming Network (PFN) energy storage candidates are capacitors and pulse generators (e.g. compulsator) with flywheel energy storage . The cyclic capability of the [8] flywheel may also allow for recovery and re-use of energy that remains in the rails and bus work. It may be possible to
