Is grid-scale energy storage on the rise? By the reckoning of the International Energy Agency (iea), a forecaster, grid-scale storage is now the fastest-growing of all the energy technologies. In 2025, some 80 gigawatts (gw) of new grid-scale energy storage will be added globally, an eight-fold increase from 2021. Grid-scale energy storage is on the rise thanks to four potent forces.

Should big batteries be used on the grid? That did not matter when only small amounts were used on the grid, but they can now make up half or more of generation capacity in some markets, creating a headache for grid operators on cloudy and still days. Big batteries attached to the grid, which store energy when it is abundant and release it when it is needed, solve that problem neatly.

Will artificial intelligence boost energy storage? A third boost for energy storage is the power-guzzling surge driven by the rise of artificial intelligence. Goldman Sachs, a bank, reckons that global power demand at data centres will rise from 240 terawatt hours (tw h) in 2020 to 600 tw h in 2025.

Grid-level large-scale electrical energy storage (GLEES) is an essential approach for balancing the supply and demand of electricity generation, distribution, and usage. Compared with conventional energy storage methods, battery technologies are desirable energy storage devices for GLEES due to their easy modularization, rapid response, flexible installation, and short ???

The transition to a low-carbon electricity system is likely to require grid-scale energy storage to smooth the variability and intermittency of renewable energy. This paper investigates whether private incentives for operating and investing in grid-scale energy storage are optimal and the need for policies that complement investments in renewables with encouraging energy storage.
