In the 1700s researchers had investigated how to harness solar energy more effectively. These efforts lead to the invention of the first solar oven and solar powered steam boats. The breakthrough discovery occurred in 1839, when a 19-year old french physicist, Edmund Becquerel, studied the photovoltaic (PV) effect and noticed that exposure to

Electricity generation with a PV system depends on the day: the system works at its full capacity on clear sunny days, whereas on cloudy days it will get more difficult to generate solar energy. Despite this, keep in mind that even on cloudy days a PV system can generate electricity. In the night only, it has no production capacity: the total
