How can Simscape power systems be used to represent a microgrid? Simscape Power Systems can be used to schematically represent a one-line microgrid diagram using blocks that represent different distributed energy resources (DERs). The DERs in this example include renewables, such as solar, a diesel GenSet, and an energy storage system (ESS).

What is a microgrid & how does it work? Microgrids are defined as "a cluster of loads, distributed generation units and energy storage systems operated in coordination to reliably supply electricity, connected to the host power system at the distribution level at a single point of connection, "the point of common coupling" (PCC)" (Figure 1) .

What DERs can be used in a microgrid? The DERs in this example include renewables, such as solar, a diesel GenSet, and an energy storage system (ESS). Using the simple microgrid, you see how desktop simulation can be used to subject the distribution system with residential load changes or unintentional islanding of the microgrid.

How phasor solution is used in a micro-grid model? The model uses Phasor solution provided by Specialized Power Systems in order to accelerate simulation speed. The micro-grid is a single-phase AC network. Energy sources are an electricity network, a solar power generation system and a storage battery. The storage battery is controlled by a battery controller.

Why is battery used in a hybrid microgrid system? Battery is used as the energy storage device to absorb excess of power and cover shortage of power. The proposed standalone hybrid microgrid system performance is carried out with MATLAB Simulink simulations under standard test condition in which  $1000\text{W/m}^2$  radiation, cell temperature  $25^\circ\text{C}$  and wind speed is  $10\text{m/s}$ .
