Can a genetic algorithm predict a lithium-ion battery cell's layered structure? Attributing specific features of a cell to wave characteristics is challenging. In this work a genetic algorithm has been developed as a means to reverse engineer a single ultrasound wave response to predict the internal layered structure of a lithium-ion battery cell. A first randomised guess at the layered structure is made.

What is a lithium ion battery? A lithium-ion battery is a multi-layer construction, consisting of multiples of anode, cathode and separator layers, each of which is referred to in this work as a ???unit cell???, see Fig. 2. The cell size depends on the number of unit cells contained in a battery and will relate to the battery capacity.

Can a sealed lithium-ion cell extract information from a battery? This study proposes a novel and powerful method to extract rich information from a sealed lithium-ion cell. The only requirement is a single wave response to an ultrasound pulse sent through the battery.

Why is ultrasonic inspection important for lithium-ion batteries? Lithium-ion batteries are sealed components and the internal states of the cell such as charge,health,and presence of structural defects are difficult to measure. Ultrasonic inspection of lithium-ion batteries is a recent and growing area of research.

What is ultrasound inspection of lithium-ion batteries? Ultrasonic inspection of lithium-ion batteries is a recent and growing area of research. Reflected and transmitted ultrasound pulses are proposed as a non-invasive means of gaining insights into the internal structure and changes within the closed body of a cell.
