

# IS CELLULOSE AN ENERGY STORAGE MATERIAL

Can cellulose be used for electrochemical energy storage?

Cellulose, being the most prevalent natural polymer on the earth, has proven to possess a lot of potential in this application. In this review, we focused on cellulose, electrochemical energy storage devices, and how cellulose derived from biomass or waste materials can be used for electrochemical energy storage.

Is cellulose a green material for energy storage devices? Nowadays, cellulose, an abundantly available biopolymer, is garnering attention as a promising green material for energy storage devices, particularly zinc ion-based energy storage devices.

Can bacterial cellulose be used in energy storage devices?

However, bacterial cellulose is promising because of its availability, easier production, and smooth application in an energy storage device. Cellulose is used as either a binder or reinforcing material for manufacturing the component of energy storage devices.

Can cellulose be used for zinc-ion energy storage? Its unique characteristics such as renewability, biodegradability, and excellent chemical stability make it a versatile candidate for various components of zinc-ion energy storage systems. By strategically modulating the properties of cellulose, advanced materials can be developed to enhance the capabilities of zinc-ion storage devices.

Can cellulose-based nanocomposites be used in energy storage devices? In previous review studies, researchers have targeted nanocellulose-based nanocomposites in energy storage applications [32,33]. There is lacking information on cellulose-based bionanocomposites and their applications in energy storage devices.

Are cellulose-based bionanocomposites the future of energy storage? Cellulose-based bionanocomposites are promising to employ for the development of energy storage devices. In general, these are made in combination with either organic or inorganic materials. Researchers have put their immense intention to develop environmentally-friendly batteries and supercapacitors from these types of advanced hybrid materials.
