Compressed air energy storage (CAES) is one of the many energy storage options that can store electric energy in the form of potential energy (compressed air) and can be deployed near central power plants or distributioncenters. In response to demand, the stored energy can be discharged by expanding the stored air with a turboexpander generator.

What is Compressed Air Energy Storage (CAES)? Compressed Air Energy Storage is a technology that stores energy by using electricity to compress air and store it in large underground caverns or tanks. When energy is needed, the compressed air is released, expanded, and heated to drive a turbine, which generates electricity.
