

Beacon Power is building the world's largest flywheel energy storage system in Stephentown, New York. The 20-megawatt system marks a milestone in flywheel energy storage technology, as similar systems have only been applied in testing and small-scale applications. The system utilizes 200 carbon fiber flywheels levitated in a vacuum chamber.

The anatomy of a flywheel energy storage device. Image used courtesy of Sino Voltaics . A major benefit of a flywheel as opposed to a conventional battery is that their expected service life is not dependent on the number of charging cycles or age. The more one charges and discharges the device in a standard battery, the more it degrades.

Flywheel energy storage technology is a form of mechanical energy storage that works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as kinetic energy.

Flywheel energy storage systems (FESS) employ kinetic energy stored in a rotating mass with very low frictional losses. Electric energy input accelerates the mass to speed via an integrated motor-generator. The energy is discharged by drawing down the kinetic energy using the same motor-generator. The amount of energy that can be stored is

Flywheel Energy Storage (FES) systems refer to the contemporary rotor-flywheels that are being used across many industries to store mechanical or electrical energy. Instead of using large iron wheels and ball bearings, advanced FES systems have rotors made of specialised high-strength materials suspended over frictionless magnetic bearings
