Electrochemical storage is a variant of the chemical one where the stored energy depends on the difference of bonding energy between two different compounds of the same element, one used as anode, the other one as a cathode. Classical example is the lead-acid battery, where the oxidation degree of lead changes from one electrode to the other one.

Resonant tank (RTN), which is also known as resonant circuit, tuned circuit, or LC circuit, contains reactive elements which store vacillating energy at the circuit's resonant ???

Element also claims to have procured 2.5GWh of second life EV batteries, which is in the order of 10 times higher than its peers. CEO Anthony Stratakos wouldn't give more detail on this when asked in a recent interview, preferring to discuss its BMS platform which he claims has numerous advantages over conventional technology.
