

LUBRICATING OIL ACCUMULATOR

What is a lube oil accumulator? There are the Channels through which oil flows to different compressor parts like gears and motors. An accumulator in a lube oil system serves as a backup reservoir that helps maintain consistent oil pressure during fluctuations in demand.

What is a lube oil system accumulator (Losa)? Fluid Energy Controls (FEC) LUBE OIL SYSTEM Accumulators (LOSA) are specifically designed for installation within turbomachinery consoles and are dedicated to maintain normal lube oil pressure at the bearings while the standby pump accelerates from an idle condition to operating speed, or during shutdown.

How many accumulators does a lube oil system need? For example, a lube oil system that feeds 400 to 500 gallons per minute requires the storage of at least 100 gallons of lubricant under high pressure. A system of that size would likely have 8 to 10 accumulators connected in series. This type of lube oil system accumulator has a spring-loaded position in a cylinder.

Can lube oil systems be installed without accumulators? Lube oil systems installed without accumulators will eventually cause critical (un-spared) unit trips that will expose the user to significant revenue losses. Clients with critical lube oil systems without accumulators will often install them eventually, after experiencing unit trips that can easily justify the modification costs.

How does an oil accumulator work? An oil accumulator is supposed to push oil to the system once the minimum pressure (the low pressure alarm + a margin) is reached. The required oil should be maintained for enough time (ideally 4+1 seconds), while the mid-pressure (pressure between the maximum and the minimum) is retained.

Does a standby oil pump need an oil accumulator? The same is true for many control oil systems (such as turbine control or hydraulic oil systems). Therefore, an oil accumulator should be provided to maintain the oil pressure and flow while the standby oil pump accelerates from an idle condition to the operating speed or has to deal with other transient situations.
