## PROGRESS TREND CHART

Are rechargeable magnesium batteries a viable solution to lithium resource scarcity? They can also achieve the integration of hydrogen production and storage via the regeneration. Furthermore, rechargeable magnesium batteries (RMBs), which possess desirable qualities that exhibit immense potential in addressing challenges related to lithium resource scarcity.

Do aqueous MG batteries have a performance booster capacity? The Mg-air full cell with 0.1 M citrate as additive displayed remarkably boosted cell voltage (from 1.54 V to 1.63 V) and energy density (from 2200 Wh kg<sup>-1</sup> to 3000 Wh kg<sup>-1</sup> based on anode mass) at current density of 1 mA cm<sup>-2</sup>. This work demonstrates that Mg<sup>2+</sup>+complexing agents possess performance booster capacity for aqueous Mg batteries.

Why are aqueous magnesium batteries a problem? By contrast, the issues of self-corrosion and chunk effect are inevitable and, therefore, are major issues hindering the broad utilization of aqueous magnesium batteries. Basically, Mg anode efficiency is below 50% when discharging in a commonly used electrolyte (e.g. 3.5 wt% NaCl solution) under a low current density (e.g. 1 mA cm<sup>-2</sup>).

Are Mg anodes a promising energy storage material? However, limitations like high desorption temperature, poor cycle life, low hydrolysis rate, and propensity for passivation layer on Mg anodes, hinder their large-scale use as promising energy storage materials (ESMs).

Which alloys are suitable for aqueous magnesium batteries? Some improvements in anode properties have been achieved and thus a large number of alloys are in the list of potential anodes for aqueous magnesium batteries, including Mg-Al-based, Mg-Li-based, Mg-Zn-Y and Mg-RE alloys, etc., as comprehensively summarized in recent papers [3,9,57,58].

## PROGRESS TREND CHART

Are magnesium based materials better than solid-state hydrogen-storage materials? Magnesium (Mg)-based materials exhibit higher hydrogen-storage density among solid-state hydrogen-storage materials (HSMs). Highly reliable hydrolysis can be achieved using them for hydrogen production. They can also achieve the integration of hydrogen production and storage via the regeneration.

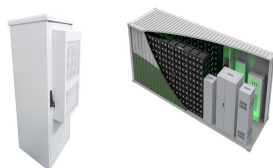

Magnesium ion batteries (MIBs) are gaining popularity as lithium ion batteries (LIBs) alternatives due to their non-negligible advantages of high energy density, abundance and low ???
