

METHANOL ENERGY STORAGE DEVELOPMENT BOTTLENECK

What is the methanol economy? Thirty years ago, George A. Olah proposed the concept of the methanol economy, where methanol replaces fossil fuels as a means of energy storage, ground transportation fuel, and raw material for the manufacture of other carbon-based products. Over the years, with rising global warming concerns, the concept has evolved.

Why is methanol a good energy carrier? The identified strengths of methanol as an energy carrier include its high volumetric energy density, the mature technology for producing it from hydrogen and carbon dioxide, and its broad applicability.

Can methanol be used as a cyclic energy source? Upcycling carbon dioxide (CO_2) and intermittently generated renewable hydrogen to stored products such as methanol (MeOH) allows the cyclic use of carbon and addresses the challenges of storage energy density, size and transportability as well as responsiveness to energy production and demand better than most storage alternatives.

How efficient is hydrogen storage compared to methanol storage? The round-trip efficiency for hydrogen storage at 38% is higher than for methanol storage with carbon cycling at 35%. Figure 2. Average electricity costs for systems based on wind and solar

Does methanol synthesis require large-scale hydrogen storage? In production facilities using fossil fuels, methanol synthesis is run with high-capacity factors. Maintaining these high load levels with fluctuating hydrogen supply from variable electricity would require large-scale hydrogen storage to buffer the hydrogen, which may not be available as discussed above.

How is methanol stored? Methanol is stored as a liquid at ambient temperature and pressure, oxygen is stored as a liquid at -183°C , and carbon dioxide is stored as a liquid at 7 bar and -50°C ; only hydrogen is stored as a gas (at 250 bar) while it is buffered before going into the methanol synthesis. With worldwide CO_2 emissions reaching a record ~37 billion tons in 2023, the path to limit global warming to 1.5°C is narrowing. The urgency to reduce emissions is further complicated by rising energy demand, which the International Energy Agency (IEA) forecasts will increase roughly 50% above current levels by 2050. Significant progress is being made to ???

Today, most of the energy consumption on the earth depends on fossil fuels, causing the global warming as a result of the large release of CO_2 into the air. To avoid depletion of natural resource and environmental pollution, developing the effective, low-cost and environmentally-friendly energy storage systems is strongly demanded.

AD Ports Group, Transmar and Orascom Construction have signed a Memorandum of Understanding (MoU) for the development of a green methanol storage and export facility in Egypt. This facility will aim to supply low-carbon fuel for maritime transport, presenting an opportunity to establish clean alternative energy storage solutions globally.

Since the start of the industrial era, the CO₂ concentration in the air has risen from 250ppm to more than 400ppm nowadays. A large part of the increase can be contributed to use of fossil fuels for energy production. To reduce CO₂ emissions, more and more capacity of renewable energy sources such as, wind power, solar PV and hydro-power are installed.

Methanol has great merits as a storage medium for renewable energy. As an energy storage medium, methanol displays high performance as an additive or substitute for gasoline in internal combustion engines. The direct conversion of the chemical energy in methanol to electrical power at ambient temperature has been demonstrated in methanol fuel

energy sources, with focus on those that are renewable. A prototype of such a methanol production system using proven technologies is described. Conditions and alternative technologies for achieving economic viability are examined. Some solutions that methanol storage offers in addressing several major problems faced by the energy

Methanol has a storage capacity of 12.1 wt% and an energy density of 3.3 kWh/L, this reduces to 10 wt% and 2.7 kWh/L including the solvents needed for dehydrogenation [1]. The methanol synthesis reaction can yield CO or methanol, with the former undesired given the toxicity of the compound [3].

A general exploration of electric energy storage through hydrogen and methanol has been performed by Rihko-Struckmann et al. [6]. The authors conclude that while the methanol system yields a "poor" system energy efficiency of 17.6%, there are significant advantages of methanol over hydrogen due to practicality of methanol storage.

Methanol is a leading candidate for storage of solar-energy-derived renewable electricity as energy-dense liquid fuel, yet there are different approaches to achieving this goal. This Perspective comparatively assesses indirect CO- and direct CO₂-based solar strategies and identifies the conditions under which the former becomes economically viable.

constructed. There are excellent reviews on renewable methanol, including current commercial operations and cost projections. (27; 28) Renewable methanol at a transportation scale will take time, but global methanol manufacturers are investing to increase production as demand for renewable methanol increases.
