Microgrids connect to the main grid through a Point of Common Coupling (PCC), which imports and exports electricity as needed. A micromanager sits at the centre and balances generation against load. Control systems within the microgrid are critical for monitoring demand and effectively matching supply. There are many different types of microgrids.

Networked microgrids is a cluster of local grids that can be connected through a weak network and can provide ancillary services. On a system point of view, it is desirable that every microgrid exhibits a behaviour at the Point of Common Coupling (PCC) which enables to share active and reactive powers with other grids.

A microgrid is a self-sustainable grid which can be operated in two modes, i.e. Grid connected mode and grid isolated mode. In grid connected mode microgrid can be connected to grid at Point of Common Coupling (PCC). This paper considers grid connected microgrid for generation scheduling. This paper analyzes the Generation scheduling at PCC in ???
