

PHASE CHANGE ENERGY STORAGE VEHICLE

Can phase change materials be used for battery thermal management? In this review article the phase change materials for battery thermal management of electric and hybrid vehicles are described. The challenges and future prospects for mitigating the battery life through TMS of EVs and HEVs by using PCMs are also described. The following key points and conclusions have been drawn based on the detailed description:

Can a phase change material be used in a battery TMS? A phase change material (PCM) could be employed for addressing such concerns when combined into a battery TMS (BTMS). Li-ion batteries are a much encouraged technology and countless studies confirm the growth of novel types of Li-ion batteries ,,,,,,,,,.

What are the characteristics of a phase change? Alteration in the crystal lattice of the material is the characteristic of such phase change. However, because the phase change temperature ranges from 80 to 180 °Celsius, the application regions are limited.

How to control the rate of heat transfer in a latent heat storage system? The rate of heat transfer in a latent heat storage system may be controlled by selecting PCMs with varied phase change temperature, thermal conductivity, and mass. PCM cooling with liquid appears to be a favorable solution for lower power and better thermal uniformity of batteries.

How to control the operating environment of an EV battery? Consequently, for controlling the operating environment of an EV battery a competent battery thermal management system (BTMS) is needed. To avoid the thermal runaways and also to uphold its performance, the battery system requires thermal management.

PHASE CHANGE ENERGY STORAGE VEHICLE

What is two phase cooling in a passive thermal management system?
There is application of two phase cooling in the passive thermal management system i.e. battery cooling,boiling liquid. When a liquid with a low boiling temperature vaporizes,it traps heat. It's used when there are minor temperature changes.

Summary The battery electric vehicle is evolving and has the potential to replace conventional internal combustion-based vehicles in the future.
