Suppose, in our case the load is 3000 Wh/per day. To know the needed total W Peak of a solar panel capacity, we use PFG factor i.e. Total W Peak of PV panel capacity = 3000 / 3.2 (PFG) = 931 W Peak. Now, the required number of PV panels are = 931 / 160W = 5.8. This way, we need 6 numbers of solar panels each rated for 160W.

As the three PV cells are connected in series, the generated output current (I) will be the same (assuming the cells are evenly matched). The total output voltage, V T will be the sum of all the individual cell voltages added together. That is: V 1 + V 2 + V 3 = 0.5V + 0.5V + 0.5V = 1.5V. Then the solar cell I???V characteristic curves of our three cells example are simply added ???
