Different from the traditional energy storage method that requires the use of chemical battery energy storage, the energy storage harness has less impact on the environment during the entire production and use process, can effectively reduce pollution and waste emissions, is conducive to improving energy efficiency, and has the effect of energy

Although, this assumes a constant power production, if intermittent production (i.e., standalone PV dealing with day/night cycles) is selected, the power needs result 2-4 times higher, approximately, even though the energy demand remains unaltered. In any case, it should be noted how the necessary energy per person remains fairly constant.

A second challenge has to do with creating an energy-efficient vacuum where metal can de-rust. Some prototypes generate a vacuum using mechanical pumps, though the pumps are too energy-intensive and costly for large-scale hydrogen production. To address these challenges, the MIT design incorporates several energy-saving workarounds.

The structure of energy storage wiring harness includes battery, connector, wire, protection device and control circuit.
