## BATTERY

Are rechargeable batteries suitable for electric vehicle energy storage systems? There are many technologies suitable for electric vehicle energy storage systems but the rechargeable battery remains at the forefront of such options. The current long-range battery-electric vehicle mostly utilizes lithium-ion batteries in its energy storage system until other efficient battery options prove their practicality to be used in EVs.

What is the energy storage system in an electric vehicle? The energy storage system is the most important component of the electric vehicle and has been so since its early pioneering days. This system can have various designs depending on the selected technology (battery packs, ultracapacitors, etc.).

Why is battery storage important? This storage is critical to integrating renewable energy sources into our electricity supply. Because improving battery technology is essential to the widespread use of plug-in electric vehicles, storage is also key to reducing our dependency on petroleum for transportation.

Why do scientists study rechargeable batteries? Scientists study processes in rechargeable batteries because they do not completely reverse as the battery is charged and discharged. Over time, the lack of a complete reversal can change the chemistry and structure of battery materials, which can reduce battery performance and safety.

How do batteries store energy? Batteries and similar devices accept, store, and release electricity on demand. Batteries use chemistry, in the form of chemical potential, to store energy, just like many other everyday energy sources. For example, logs and oxygen both store energy in their chemical bonds until burning converts some of that chemical energy to heat.

Why are batteries and supercapacitors used in hybrid energy systems? In hybrid energy systems, batteries and supercapacitors are always utilized because of the better performance on smoothing the output power at start-up transmission and various load conditions (Cai et al., 2014). On the other hand, PHEV and BEV requires energy storage charging system, which introduces a new challenge to the grid integration.

Nanogrids are expected to play a significant role in managing the ever-increasing distributed renewable energy sources. If an off-grid nanogrid can supply fully-charged batteries to a battery swapping station (BSS) serving regional electric vehicles (EVs), it will help establish a structure for implementing renewable-energy-to-vehicle systems.
