

PRINCIPLE OF THE ENERGY STORAGE MOTOR OF THE MANIPULATOR

How to reduce the energy consumption of a manipulator driving system? There are two ways to reduce the energy consumption of the manipulator driving system. One way is to improve the driving system efficiency through reducing the valve throttle loss. The other is to recover and reutilize the lost gravitational potential energy.

How can a multi-joint heavy-duty manipulator save energy? The gravitational potential energy recovery and reutilization efficiency is greatly improved. The results show that the effect of energy saving is remarkable. Multi-joint heavy-duty manipulators, such as working devices of hydraulic excavators, are mostly driven by hydraulic cylinders.

Can axial flux partially-self-bearing permanent magnet machine sustain a compact flywheel energy storage system? Conclusion A compact flywheel energy storage system sustained by axial flux partially-self-bearing permanent magnet machine has been proposed and the prototype has been built up to validate the feasibility of the design concept. The PID control algorithm has been implemented in a DSP-based control platform.

Why is EMA difficult to drive a heavy-duty manipulator independently? However, due to the low power density ratio, the EMA is difficult to drive the heavy-duty manipulator independently. For the energy recovery mode, the hydraulic mode has less energy conversion links than the electrical mode.

How is a robotic manipulator made? A robotic manipulator (robotic arm) is constructed using four rotary joints and an end effector, where rotary motion is provided by a servomotor. Each link is first designed using Solid works Sheet Metal Working Toolbox and then fabricated using a 2mm thick Aluminum sheet. The servomotors and links thus produced assemble.

What type of driving system is used in a heavy-duty manipulator? An EMA and a hydraulic cylinder-hydraulic accumulator combination are used to drive the manipulator together. Furthermore, electrically active and hydraulically passive driving systems are employed based on the operational characteristics of the heavy-duty manipulator.
