

What is shared energy storage? Shared energy storage is generally applied in the supply,network,and demand sides of power systems. The shared energy storage at the supply side is mainly utilized for renewable energy consumption(Zhang et al.,2021). The proportion of renewable energy is greatly increasing due to the continuous promotion of "carbon peaking and neutrality".

Does a shared energy storage system reduce the cost of energy storage? The results show that the construction of a shared energy storage system in multi-microgrids has significantly reduced the costand configuration capacity and rated power of individual energy storage systems in each microgrid.

How is the sharing economy applied in smart grids? In recent years,the sharing economy has been initially applied in smart grids to address the problems caused by increasing renewable energy. The typical applications include: Shared energy storage(Kalathil et al.,2019): it is the application of the sharing economy in the field of energy storage.

Can shared community energy storage systems be used in residential areas? A novel energy cooperation framework was proposed to operate and distribute profits from shared community energy storage systems in residential areas. Mediwaththe et al. conducted a study on SES-based demand side management in a neighborhood network, demonstrating the benefits for the SES provider, users, and electricity retailer.

What is the business model of a shared energy storage system? The business model of the shared energy storage system is introduced, where microgrids can lease energy storage services and generate profits. The system is optimized using an economic double-layer optimization model that considers both operational and planning variables while also taking into account user demand.

How much power does a shared energy storage system have? The system reaches its maximum discharge power of 285 kW at 13:00 and maximum charge power of 371 kW at 12:00. Throughout most of the day, the charge and discharge power remains around 100 kW. The shared energy storage system effectively facilitates energy exchange among multiple Microgrid and achieves full charging cycles.
