A solar module comprises six components, but arguably the most important one is the photovoltaic cell, which generates electricity. The conversion of sunlight, made up of particles called photons, into electrical energy by a solar cell is called the "photovoltaic effect" - hence why we refer to solar cells as "photovoltaic", or PV for short.

The photovoltaic panel converts into electricity the energy of the solar radiation impinging on its surface, thanks to the energy it possesses, which is directly proportional to frequency and inversely to wavelength: this means ???

Multi-Junction Solar Panels: The major loss in solar cells is the incapability of a solar cell to harness all the light energy from the sun and thereby leading to power losses. There are 2 reasons why this takes place: Firstly, if the photon energy is lower than the bandgap energy, the energy from photons is not collected at all.
