Which PTEs variant uses supercritical carbon dioxide as the working fluid? In this article, a PTES variant that uses supercritical carbon dioxide (sCO2) as the working fluid is introduced. sCO2-PTEScycles have higher work ratios and power densities than the systems based on ideal gases that have been investigated to date.

How does a hot fluid transfer energy to a cold storage media? The hot fluid transfers its energy to a thermal storage media such as a packed bed of rocks or molten salt (23) before being expanded (and cooled) to its original pressure (34), before finally exchanging heat with the cold storage media (41). The charging process thus creates a cold store and a hot store.

Can molten salts be used as a bulk electricity storage device? Currently, Malta Inc. are developing a 10 MWe /80 MWhe system based on the recuperated Joule-Brayton cycle with molten salts as storage media . As a bulk electricity storage device, PTESmay enable high penetrations of variable renewable generation on the electrical grid.

Does supercritical CO2 affect round-trip efficiency? Supercritical CO2 exhibits large variations in heat capacity, particularly near the critical point, which may lead to the maximum achievable round-trip efficiency being limited predominantly by heat transfer irreversibilities. These preliminary results will be refined in future work to account for heat capacity variations.
