

# TEAR DOWN FENGJUN 5 AND REPLACE THE GENERATOR

How to remove a generator from an engine shaft? Gathering the necessary tools is the first step in removing a generator from an engine shaft. It is essential to have the right tools at hand to ensure the process is smooth and efficient. Below are the tools required for this task: A socket wrench is an essential tool for this job.

How do you reinstall a generator? Keep track of each bolt and any accompanying washers to ensure they can be easily retrieved for reinstallation. Once the mounting bolts are removed, gently lift and detach the generator from the engine shaft. It's crucial to handle the generator with care to prevent any damage during this process.

How do you reassemble a generator? Begin by disconnecting the power source to the generator. This may involve shutting off the main power supply, unplugging the generator, or disconnecting the battery. Carefully locate and disconnect all wiring connected to the generator. Take note of the connections to ensure proper reassembly later.

How do I remove a generator armature bearing? To remove a generator armature bearing, first disconnect power and disassemble the generator. Use a bearing puller to carefully remove the bearing from the armature shaft. Ensure the area is clean and inspect for any damage before installing a new bearing.

How do you remove a generator? A screwdriver, particularly a flathead or Phillips head, is necessary to remove any screws or fasteners holding the generator in place. It allows for easy access to these components and facilitates safe removal. Protective gloves are crucial for safety during the removal process.

All I know is once started I immediately knew it was not right. Sounded like it had a 100 amp load on it. If my customer buys a new engine from us I'll tear down and let you know the root cause of the pump failure. But if you tear yours down let me know what your root cause is, in case I'm not able to get her old engine to autopsy.

As per the other thread (Which 20KW whole house generator would you choose and why), the Generac tech that came out said the engine passed compression test fine, but that cylinder #1 had a 28% leak down and #2 had 48% leak down. 28% the cut off Generac uses to replace engines under warranty.

I need to replace the rear crank seal (it's leaking like crazy), and to do that, I need to remove the rotor. I understand that I can tip it up vertically, fill the space where the rotor bolt was with oil, ???

And is it possible to replace these from the right side of the generator without having to completely remove the engine from the compartment? The diagnostic repair manual states that you have to remove the engine and tear down until the magnetos are visible. That's a huge job; if it is possible to access it from the right side it would be sweet!
