

How is energy stored on a capacitor expressed? The energy stored on a capacitor can be expressed in terms of the work done by the battery. How does a charged capacitor store energy? A charged capacitor stores energy in the electrical fieldbetween its plates. As the capacitor is being charged,the electrical field builds up. When a charged capacitor is disconnected from a battery,its energy remains in the field in the space between its plates.

How do you calculate the energy needed to charge a capacitor? The total work W needed to charge a capacitor is the electrical potential energy UC U C stored in it,or UC = W U C = W. When the charge is expressed in coulombs, potential is expressed in volts, and the capacitance is expressed in farads, this relation gives the energy in joules.
