

THE REASON WHY THE COST OF ELECTRIC ENERGY STORAGE IS HIGH

Why are cost projections important for electrical energy storage? Cost projections are important for understanding the role of electrical energy storage in future low-carbon electricity systems, but data are scarce and uncertain. Electrical energy storage could play a pivotal role in future low-carbon electricity systems, balancing inflexible or intermittent supply with demand.

Does storage reduce the cost of electricity? In general, they conclude that storage provides only a small contribution to meet residual electricity peak load in the current and near-future energy system. This results in the statement that each new storage deployed in addition to the existing ones makes the price spread smaller, see Figure 16, and, hence, reduces its own economic benefits.

How much do electric energy storage technologies cost? Here, we project future prices for 11 electrical energy storage technologies. We find that, regardless of technology, capital costs are on a trajectory towards US\$340 / kWh for installed stationary systems and US\$175 / kWh for battery packs once 1 TWh of capacity is installed for each technology.

Do storage costs compete with electricity prices? In this context, storage costs compete with the price of electricity for end consumers, and if they are less than the final electricity prices (with all fees and taxes considered but not including the fixed costs), then the costs of storage demonstrate a positive economic performance.

Why is electrical energy storage important? Electrical energy storage is expected to be important for decarbonizing personal transport and enabling highly renewable electricity systems. Thus, our experience-curve data set removes a barrier for further study by industry, policymakers, and academics.

THE REASON WHY THE COST OF ELECTRIC ENERGY STORAGE IS HIGH

Is electricity storage an economic solution? Electricity storage is currently an economic solution of-grid in solar home systems and mini-grids where it can also increase the fraction of renewable energy in the system to as high as 100% (IRENA,2016c). The same applies in the case of islands or other isolated grids that are reliant on diesel-fired electricity (IRENA,2016a; IRENA,2016d).
