How can I store energy directly on the seafloor? Contact us. With our new subsea energy storage system, based on our membrane-based storage solution for oil and chemicals, you can now store liquid clean energy, such as ammonia or e-methanol, directly on the seafloor.

What is a Subsea energy storage system? The subsea energy storage system consists of the following main elements: storage units, a fluid transfer and refilling system, heating and circulation system, control and instrumentation, power supply, and structure and foundation. An example with a fixed platform with five 5,000 m³ storage units, gives a total storage volume of 25,000 m³.

What are the applications of offshore energy storage? This technology can be used in a variety of applications, like power storage for offshore assets, offshore fueling stations for ships, renewable energy storage with offshore wind turbines, or common storage of ammonia for fertilizer plants. How does it work?

What is Ocean battery undersea energy storage? The ???ocean battery??? undersea energy storage concept is more similar to pumped hydro storage, in which renewable energy is used to pump water uphill to a reservoir. When extra electricity is needed, gravity is deployed to release the water downhill to hydropower generators.

Can a membrane-based subsea storage solution be used as a hydrogen energy carrier? Paper presented at the Offshore Technology Conference, Virtual and Houston, Texas, August 2021. This paper demonstrates a pioneering technology adaption for using a membrane-based subsea storage solution for oil/condensate, modified into storing clean energy storage in the form of ammonia (as a hydrogen energy carrier).

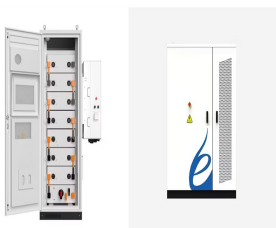

UNDERSEA OIL FIELD ENERGY STORAGE

How can ammonia be stored at the seabed? Storing ammonia at the seabed using innovative subsea storage technologies will dramatically reduce CO2 emissions for offshore assets. The fluid will be stored in a safe manner on the seafloor, protecting both personnel and marine life.

An example with a fixed platform with five 5,000 m³ storage units, gives a total storage volume of 25,000 m³. Energy storage with ammonia, given the density of ammonia, gives 19,000 tons of fuel. Each ton of ammonia gives 5,17 MWh of ???
