

USING MAGNETS TO STORE ENERGY

Why is magnetic energy stored in different materials? Since electric currents generate a magnetic field, magnetic energy is due to electric charges in motion. Magnetic fields are generated by permanent magnets, electromagnets, and changing electric fields. Energy is stored in these magnetic materials to perform work and is different for different materials.

Do permanent magnets have potential energy? Permanent magnets do have potential energy, stored in their magnetic field. That energy can be compared to the potential energy of some compressed spring. See the picture below, representing the magnetic field lines of a magnetized sphere : These lines are compressed inside the magnet.

Why do permanent magnets move upwards? So, the fact that the ball moves upwards is compatible with the conservation of the energy. Permanent magnets do have potential energy, stored in their magnetic field. That energy can be compared to the potential energy of some compressed spring. See the picture below, representing the magnetic field lines of a magnetized sphere :

Why are magnets not used as energy? Ans. Magnets are not used as energy because they do not inherently possess any energy. For example, in a generator, we do not get energy from the magnetic field. The energy going into the electrical current comes from the energy required to spin the coil between the two magnets. Q.2. How can magnets cause objects to have kinetic energy?

Why is magnetic energy a form of potential energy? Energy is stored in these magnetic materials to perform work and is different for different materials. Since it is stored energy, magnetic energy is a form of potential energy. Scottish mathematician and scientist James Clerk Maxwell are credited with having discovered magnetic energy during his pioneering work on electromagnetism in 1865.

Gravity just provides a way to temporarily store energy in an object. We call the energy that an object gains when you lift it against a force "potential energy". The energy comes from the lifting agent and not from the force. The magnetic force just provides a way for potential energy to be stored in the magnet (by virtue of you pulling

USING MAGNETS TO STORE ENERGY

My question is that if magnetic field cannot do work, then what does the energy signify? The energy stored in the magnetic field of an inductor can do work (deliver power). The energy stored in the magnetic field of the inductor is essentially kinetic energy (the energy stored in the electric field of a capacitor is potential energy).

A stronger magnetic field has a higher energy storage capacity. The factor of the magnetic permeability (μ) is intriguing. The medium's permeability determines how well it can establish a magnetic field within it and, consequently, the amount of energy that can be stored. Higher permeability permits more substantial energy storage.

The energy storage capability of electromagnets can be much greater than that of capacitors of comparable size. Especially interesting is the possibility of the use of superconductor alloys to carry current in such devices. But before that is discussed, it is necessary to consider the basic aspects of energy storage in magnetic systems.

The potential magnetic energy of a magnet or magnetic moment in a magnetic field is defined as the mechanical work of the magnetic force on the re-alignment of the vector of the magnetic dipole moment and is equal to: $U = -\vec{m} \cdot \vec{B}$. The mechanical work takes the form of a torque $\tau = \vec{m} \times \vec{B}$ which will act to "realign" the magnetic dipole with the magnetic field. [1] In an electronic circuit the ???
