What determines the design of a compressed air energy storage system? The reverse operation of both components to each otherdetermines their design when integrated on a compressed air energy storage system. The screw and scroll are two examples of expanders, classified under reciprocating and rotary types.

What determinants determine the efficiency of compressed air energy MULTIPLE WORKING MODES storage systems? Research has shown that isentropic efficiencyfor E compressors as well as expanders are key determinants of the overall characteristics and efficiency of compressed air energy storage systems . Compressed air energy storage systems are sub divided into three categories: diabatic CAES systems, adiabatic CAES systems and

isothermal CAES systems.

What are the stages of a compressed air energy storage system? There are several compression and expansion stages: from the charging to the discharging phases of the storage system. Research has shown that isentropic efficiency for compressors as well as expanders are key determinants of the overall characteristics and efficiency of compressed air energy storage systems .

Are energy storage systems a fundamental part of an efficient energy scheme? Energy storage systems are a fundamental part of any efficient energy scheme. Because of this, different storage techniques may be adopted, depending on both the type of source and the characteristics of the source. In this investigation, present contribution highlights current developments on compressed air storage systems (CAES).

Are compressed air energy storage systems suitable for different applications? Modularity of compressed air energy storage systems is another key issue that needs further investigation in other to make them ideal for various applications. The authors declare that they have no known competing financial interests or personal relationships that could

have appeared to influence the work reported in this paper.

Where can compressed air energy be stored? The number of sites available for compressed air energy storage is higher compared to those of pumped hydro [,]. Porous rocks and cavern reservoirs are also ideal storage sites for CAES. Gas storage locationsare capable of being used as sites for storage of compressed air .
