

Which backup power system should a data center have? Data centers generally only have two options for backup power: UPS systemsand backup generators. However, these two can combine in various ways when admins consider a data center's requirements and location. Below are a few considerations for choosing the right backup power system for your data center.

What is a backup power system? A backup power system provides redundancy and resilience to keep critical infrastructure online,whether it be a small power fluctuation or a full outage. Most data centers use a combination of uninterruptible power supply (UPS) systems and diesel backup generators for backup power.

What is a battery energy storage system? A battery energy storage system (BESS) is an electrochemical device that charges from the grid or a power plant and then discharges that energyto provide electricity or other grid services when needed.

What is the cycle life of a battery storage system? Cycle life/lifetime is the amount of time or cycles a battery storage system can provide regular charging and discharging before failure or significant degradation. For example, a battery with 1 MW of power capacity and 4 MWh of usable energy capacity will have a storage duration of four hours.

Who uses battery storage? Battery storage is a technology that enables power system operators and utilities to store energy for later use.
