

WHERE IS THE FENGJUN 5 POWER REGULATOR

A voltage regulator is a component of the power supply unit that ensures a steady constant voltage supply through all operational conditions. It regulates voltage during power fluctuations and variations in loads. It can regulate AC as well as DC voltages. SMPS and a wall charger - both have an onboard voltage regulator

The most efficient way would be to use a Buck Converter which is a type of Switching Regulator. This type of regulator is far more efficient than a linear regulator, as it converts the power rather than intentionally dissipating the extra as heat. Wasted power in your example if your circuit is drawing 100mA would be roughly: $(9V-5V) * 0.1A = 0.4W$
