Where do encharge storage systems & generator conductors enter?
Encharge storage system and PV combiner and generator conductors may enter from the bottom, bottom-left or bottom-right sides. Encharge storage system ??? Conduit may enter from the top right or top left of the Encharge storage system at the pre-defined knockout locations.

Can the encharge storage system be added to an existing system? The Encharge storage system can be added to an existing system without using an Enpower smart switch, however, it will not provide backup power. When installed in this configuration, the Encharge storage system is treated as a distributed energy resource (DER), equivalent to a PV system, and cannot form an intentional island.

How many encharge storage system units can be connected? 2. The desired number of Encharge storage system units is the value calculated in step 3. The maximum allowed number of Encharge 3 units that can be connected to a single Enpower smart switch is 12 (four Encharge 10). The following table identifies the maximum number of microinverters that can be connected to a given Encharge storage system size.

How does the encharge storage system work? There are two common configurations that allow the Encharge storage system to provide power to customer loads independent of the grid. In the whole home (main load panel) backup configuration, Enpower smart switch is installed on the line-side of the main load panels rated up to 200A.

What is an airflow proving switch? The AFS is a general purpose airflow proving switch designed for HVAC and energy management applications. It may be used to sense positive, negative or differential air pressure. The plated housing contains a diaphragm, a calibration spring and a snap-acting SPDT (NC) switch.

What type of inverter/charger does the energy storage system use? The Energy Storage System uses a MultiPlus or Quattro bidirectional inverter/charger as its main component. Note that ESS can only be installed on VE.Bus model Multis and Quattros which feature the 2nd generation microprocessor (26 or 27). All new VE.Bus Inverter/Chargers currently shipping have 2nd generation chips.

The PCS requires adequate protection and switch-ing capability on the AC and DC side in order to switch the system - also in the load condition - and protect the entire electrical ???
